

Immunization

Below are the most important diseases for which vaccines are currently available:

Rabies, one of the world's most publicized and feared diseases, is always fatal. Rabies virus attacks the nervous system, and is transmitted chiefly through the bite of an infected animal.

Distemper, is among a very contagious and fatal disease of the respiratory tract, gastrointestinal tract, and nervous system. It is transmitted through contact with bodily and airborne secretions.

Canine adenovirus, type 2 is associated with infectious hepatitis and infectious tracheobronchitis. It is spread through bodily and airborne secretions.

Parainfluenza is a common and highly contagious cause of infectious tracheobronchitis. It is an airborne disease.

Parvovirus is a highly contagious, aggressive, and often fatal gastrointestinal virus. It is transmitted through direct contact with infected animals, feces, and other objects that have traces of the virus.

Lyme disease is transmitted through tick bites. It is difficult to diagnose in dogs because they do not show the same symptoms as humans. The most common sign described is that the dog is "walking on eggshells."

Leptospirosis is an infection that is contracted through skin contact with infected water, soil, mud, or the urine of an infected animal. It can be transmitted to humans.

Bordatella is associated with respiratory disease (kennel cough). It can be transmitted to cats, rabbits, and humans. It is highly contagious and transmitted through the air and direct contact.

Influenza is one of the viral causes of kennel cough. It is highly contagious through contact with other infected dogs. The fatality rate is low, but most dogs have not been exposed or vaccinated for it.
